EXPERIMENT 03

Survey of emerging low code trends

Aim

Prepare a source-based survey of emerging low code practices and judge their relevance to the vehicle service application.

Procedure

1. Define questions: which tasks are AI-assisted, how are integrations governed, what stays a developer's job?
2. Collect at least five official sources (Creator, Deluge, CRM API, Catalyst docs). Record title, URL, access date and licensing notes.
3. Classify evidence: AI-assisted development, conversational interfaces, API integration, governed citizen development, embedded analytics, hybrid low code plus pro code.
4. For each trend separate a documented feature from your interpretation. Do not turn feature lists into adoption statistics.
5. Optional: a small voluntary questionnaire; record sample size and method. If none, label it a desk survey.

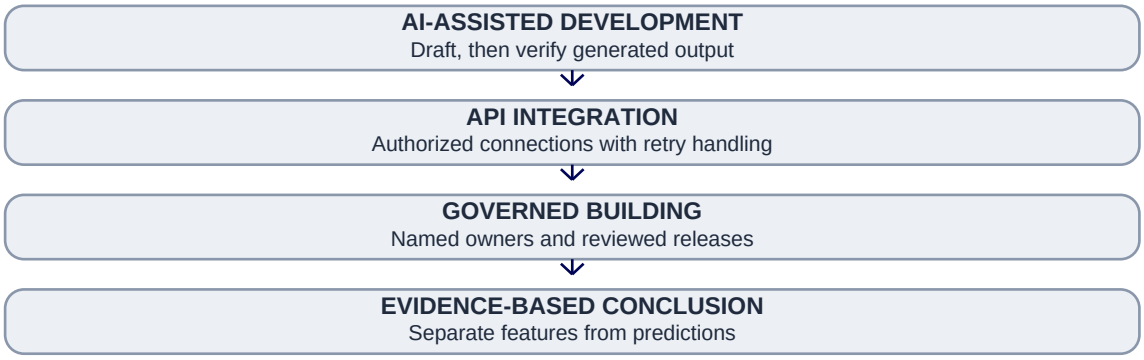
Implementation and verification

Trend	Service-center use	Evaluation question
AI assistance	Draft status-update scripts.	Does a human review catch wrong logic?
API composition	Send pickup notices / sync owners to CRM.	Do retries avoid duplicate messages?
Governed development	Separate builders from front-office staff.	Who approves releases?
Built-in analytics	Bay and service-type charts.	Do totals match source records?
Hybrid architecture	Specialized validation via Catalyst.	Is the extra service worth its cost?

Evidence and testing

E03: bibliography, source extraction table, finished discussion with limitations.

Process diagram



Generated explanatory diagram. It is not a screenshot of an executed workflow.

Result

Expected result and verification criteria. At least five trends are explained with traceable sources; documented capabilities, predictions and any survey data are clearly separated.
