EXPERIMENT 12

Security, governance and administration

Aim

Establish safeguards for owner data, privileged actions, changes and recovery.

Procedure

1. Inventory data: public service types, restricted owner contact data, restricted vehicle files (insurance copies, photos), secret credentials. Collect only needed fields.
2. Apply least privilege; review public links, exports, mobile access; remove unused users and connections.
3. Keep secrets in connections; never in fields, scripts, logs or screenshots; revoke a test credential and confirm it fails.
4. Inspect platform audit for a create, edit and export action; note retention.
5. Draft a retention policy for approval (do not call it a legal requirement); run a backup and restore drill in an isolated location.
6. Document change control, quarterly access reviews and incident steps: contain, preserve logs, notify owner, investigate.

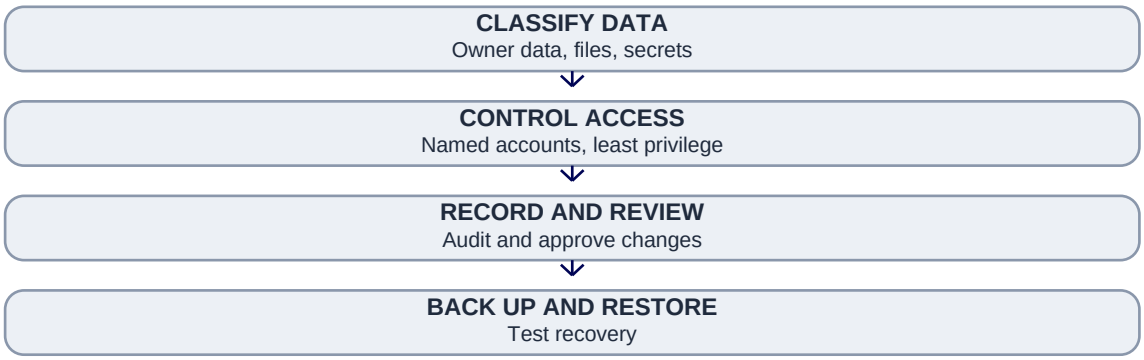
Implementation and verification

Control	Owner	Verification
Permissions review	App administrator	Role matrix checked
Change approval	Application owner	Release notes retained
Backup and restore	Administrator	Counts and lookups reconcile
Connection lifecycle	Integration owner	Scopes and revocation tested
Data minimization	Service manager	Unneeded fields removed

Evidence and testing

E12: data inventory, control register, sanitized audit entries, restore results, incident exercise notes.

Process diagram



Generated explanatory diagram. It is not a screenshot of an executed workflow.

Result

Expected result and verification criteria. Controls have owners and evidence; restore and revocation work; residual risks are recorded, not claimed as resolved.
